

Tipler Physics II

Roger J Anderton

R.J.Anderton@btinternet.com

Frank Tipler, Professor of mathematical physics has been saying some strange things about mainstream physics. There appears to be an elite in mainstream physics that does not believe the myths told in student texts and popular physics literature. Above the lower levels of physicists there is an elite who know a better version of theoretical physics. Details now follow of the Unified Field Theory.

Frank Tipler tells us [1]

“In 1954, Max Born was awarded the Nobel Prize in Physics for a result that was actually disproved three years later, though many physicists are not even today aware of this refutation.”

Hold on a moment, let's step back a moment:

1. Born was given a Nobel prize and it was a mistake; ideally Born should have given the prize back. But no doubt that never happened, because there is no account of Born returning a Nobel Prize as far as I know.
2. And “many physicists are no aware” of this!! Tipler is definitely in some elite if he knows this and says that other physicists outside this elite are not aware.
3. Max Born's “result” is what is taught to physics students when they do Quantum mechanics courses. So the education establishment is teaching physics students wrong! It's about time that the education establishment stopped teaching physics students wrong.

Tipler continues: “Born had claimed that the most important concept in quantum mechanics, the wave function, was a measure of the probability that an event would occur, and that there was a fundamental randomness in nature.”

Yes that is definitely what is taught physics students in Quantum mechanics courses, and Tipler says it’s wrong.

Tipler: “But quantum mechanics is really more deterministic than classical mechanics. Einstein was utterly correct when he said, “God does not play dice with the universe.””

Hold on a minute. Einstein was correct about Quantum mechanics all the time! Physics is deterministic not random.

1. But students are still being taught Quantum mechanics as being random, not deterministic. And they are being taught Einstein was wrong on this issue. Not only that-
2. Popular physics books are also saying that Einstein was wrong about nature being deterministic. Surely all of this needs to be corrected in the literature.
3. Einstein was searching for his Unified field theory based up deterministic not upon random, so that means despite his difficulty the Unified Field Theory program is the correct route to follow. With all of this misinformation being presented about that, only this elite which Tipler is a part of knows that, and the rest of the lower level physicists are taught incorrectly and diverted onto the wrong track.

Tipler: “ Hugh Everett proved Einstein correct in 1957, when he showed that the wave function is not a measure of a probability, but rather a measure of the density of universes identical to ours but parallel to ours in the overall reality called the “multiverse.””

And of course Hugh Everett was working from earlier ideas, and the original source of the multiverse comes from the Unified Field Theory of Boscovich.

Tipler continues: “Erwin Schrödinger, who discovered the equation that governs the wave function, actually pointed this out in 1926, but he was ignored. The prestige of the Nobel awarded to Born has been an

important reason why the Everett-Schrödinger true and correct theory of the wave function has not been generally accepted. The Nobel Prize has held up the advance of physics. »

i.e the incorrect awarding of Nobel prizes is serving as to a block in physics progress. So Nobel prizes in physics should be returned when they have been found to been awarded incorrectly !
