Paper 7

Introduction

All qualities of spirit and matter are contained in the infinitely lower and higher levels of space, motion and time.

Note that a body can never exist without spirit. Although I have much respect for Einstein's equation, $E=mc^2$, it appears that he was unable to understand the mystery of its correlate. Spirit arises from both the equations $E=mc^2$ and $E=mc^{-2}$.

For science of the spirit

$$E=mc^{-2}$$

For the science of matter

$$E=mc^2$$

Demonstration

We know both equations are representations of every entity in such a manner as to occur continuously and simultaneously from birth to death. As one aspect increases in activity, energy, the other decreases in direct proportion, existing as potential. They occupy the extreme positions in the states of birth and death.

Experiment

Quantification is extremely difficult although the reciprocal and synonymous action of both is evident, participating in the emergence of one and recession of the other at the speed of light. Calm inaction and contemplation are the hallmarks of the one state and precipitate action of the other.
