

Dear Scientists, Engineers and Thinkers,

I have been interviewed by American scientists in order to explain why the black hole is not predicted by General Relativity or by Newton's theory and is therefore fallacious. So it is no wonder that nobody has ever found a black hole despite the almost daily reports for them being found all over the place and being responsible for all sorts of things. It is even now being claimed that quasars are black holes. That amounts to a convenient each-way bet! The search of the black hole has always been destined to detect nothing. All reports for the discovery of black holes are false; the product of wishful thinking.

The interview is here:

In relation to this interview you might be interested in these two short and simple papers:

On the Alleged "Black Hole" Binary in Nova Scorpii

<http://viXra.org/abs/1206.0081>

On the Alleged 'Supermassive Black Hole' in the Bright Quasar 3C 279
(An Open Letter to Weintraub et al.)

<http://viXra.org/abs/1208.0228>

I owe a number of you private replies to emails and your papers. I will attend to them as soon as I can. Any such person who has not heard from me for some time is invited to send me a reminder email as some originals may have got lost in my records and therefore have been overlooked by me. I wish to reply to all who have asked me to do so. I hope I have not offended anybody by my delay in response.

I will soon go abroad to attend an astrophysics conference and I will cover the material in the foregoing interview then too, along with the invalidity of Einstein's gravitational waves, Big Bang cosmology and its alleged expansion of the Universe, and the invalidity of General Relativity itself for violation of the usual conservation of energy and momentum. Thus the search for Einstein's gravitational waves has also always been destined to detect nothing, and the so-called Cosmic Microwave Background Radiation is certainly not the afterglow of a Big Bang creatio ex nihilo.

Yours faithfully,
Steve Crothers
