

CANCER – New autologous treatment

Nillo Gallindo's Essay Biomedicine student

nillo.gestorjuridico@bol.com.br BRAZIL

ABSTRACT: TO ALL ONCOLOGISTS AND VACCINE MANUFACTURERS IN THE WORLD

Cancer is usually initiated in the DNA of a cell that aims to have eternal life. At the end of its natural life, the cell that will turn into cancer refuses to die naturally and be replaced by a new one like it, so instead of accepting the APOPTOSIS process, its DNA forces its RNA to change something in the his genetic code and transforming her and all her future replicas into different cells called “cancerous” that are rapidly multiplying, disordered, aggressive, invading tissues and with a self-defense that makes them “invisible” and undetectable to the body's defense cells. That is why they are successful. I speak here of any type of cancer. Cancer, then, is an individualized disease in the eight billion human beings originating in each person's private DNA. We don't want to know why, we want a cure.

Why haven't you tried this method yet? It is cheap, simple, easy and very fast and will not harm any patient because the patient already has cancer and other conventional treatments. This treatment will not harm anything. I propose this. In the laboratory, make them inactive attenuated to the maximum until they lose all the defense actions they have against the body's defense cells (you know how to do this, whether by chemistry or another method). They must be attenuated to the maximum or completely inactivated. Then they must be inoculated again into the patient. As in reaction to any vaccine, the body's defense cells will produce defense antibodies that will attack these inactivated cancer cells (because they are inactivated they will not deceive the organism's defenses with invisibility) and the defense cells for having formed a large army will also attack by similarity to the cells entrenched in the true tumor. This is the universal and simple principle of vaccines. Remember Dr. Edward Jenner's smallpox, girls and cows in the 18th century. Here in this method it will be an AUTOLOGOUS treatment.

VERY IMPORTANT - Pay close attention to what I have described. This treatment is AUTOLOGOUS and individualized from the patient to the same patient already sick, cancer cells from one person can never be used in a different one, because each human being on the planet has a different DNA. The principle of action and reaction of the body's defenses is the same for all; however the method is different. In the 18th century, Dr. Edward Jenner's method the cells of a cow were suitable for all girls, but in this autologous treatment you can only use inactivated cells from one person to herself and never to another. Understood?
