ETHER WITHIN PHYSICAL BODIES

© Yuri Dunaev, 2021

Key words

Ether, elonosphere, elon gas, Michelson-Morley

Abstract

Any physical body may be imagined as composed with baryon matter particles creating its carcass and the ether filling up the gaps there between.

Ether or elon gas that fills up all the universe space including those volumes which are in gaps between the baryon particles of physical bodies resists its motion relative baryon matter particles and composed therewith physical bodies such as e.g. planets, satellites and their fragments, as well as objects of usual circulation. Therefore the ether situated within baryon matter constructions resists any actions that might damage its placing relative such constructions' elements, and for such reason any planet might be imagined as a body composed not only with baryon matter that makes up its carcass but also with the ether, which fills up gaps between its particles and is with these particles physically connected.

For this reason a planet e.g, our Earth while orbiting the Sun interacts with interplanetary ether as a holistic body composed with baryon carcass that also includes atmosphere and adjacent thereto intraterrestrial ether.

While setting up their famous experiment that would measure the speed of ether motion relative the Earth Michelson and Morley indeed measured the speed of baryon terrestrial carcass relative the intraterrestrial ether. Unsurprisingly the result they and not only they had obtained was nul.
