

Basic Heat Energy Theory:

Abstract: In this theory I will explain how the heat energy generated and spread surrounding all in the universe and I will explain all other facts which are unknown in the universe.

Keywords: Heat, universe, chemical reaction, expanding universe, matter, sea level.

Introduction: In my theory "Universe Birth Theory" I explained how the universe born and how the universe ends. The universe expands and if it expands certainly it will shrink. The universe expands because it is in younger age and it is growing and when it becomes oldest it will shrink. So in this theory I will explain how the heat energy generated and spread all over the universe and from where all the solid, liquid and gaseous matter came to our universe. For reference read " Universe Birth Theory".

1. What is the main source of heat energy generating in the universe?

Explanation: Almost all the solid bodies are heat or hot in the universe and they are hot because heat is not generating in the universe not due to something or else due to nuclear reaction; instead heat is generating in the universe due to universe expansion. When the universe totally shrank it became like a single point like an ovum and the ovum exploded due to high density inside it due to chemical reaction and all the ingredients from the ovum came outside and from these basic fundamental ingredients the universe became once again like a filled pitcher with all solid, liquid and gaseous matter. What I want to tell is that the universe expansion makes the universe filled with all solid, liquid and gaseous matter. When the ovum explodes all the ingredients from it will come outside and these basic ingredients will enlarge in quantity due to universe expansion because when the universe expands pressure in these ingredients increase due to air penetration and due to air penetration the atoms in metallic bodies expand till the bodies become enlarge in some quantity or weight and when this enlargement still increases the atoms instead of expanding they will burn the complete body because the atoms will no more expand due to disorder in the atomic structure and the body completely burns. However it is certainly true that nuclear reaction is taking place inside the all stars but before nuclear reaction and before the birth of stars the main fundamental metallic element will burn and this fundamental metallic

element will give birth to stars and this fundamental metallic element burns due to universe expansion. By such process the basic fundamental heat energy generates in the universe and this basic heat energy makes special in the universe like nuclear reaction.

2. What is dark energy?

Explanation: Dark energy is a special type of energy in the universe and it is present everywhere in the universe and it is the result of product of burning phenomenon of iron or rust iron and after burning these particles (carbon particles) spread everywhere in the universe. So dark energy is the particles mostly consisting of carbon ingredients.

3. What is dark Matter?

Explanation: Dark matter is nothing but the product of already burnt matter and definitely it consists of iron and carbon ingredients because dark matter exists in the stars and black holes.

4. Does time stops?

Explanation: Time will not stop until the universe shrinks totally; when the universe totally shrinks then only the time stops because after shrank the universe will become a single point for several billion years till it explodes once again and definitely the time stops for some billion years.

5. Shape of the universe: It is highly difficult to find out the shape of the universe because the universe is infinite. But my theory "Universe Birth Theory" predicts that the shape of the universe is spherical because when the universe becomes almost a single point after totally shrinking due to the oldest age of the universe; it explodes and the explosive pressure will be equal in all directions and steadily it expands. Due to this the universe is almost spherical, it may be spherical cylindrical shape.

6. Why the sea level increases during full moon?

Explanation: The sea level increases during full moon not due to gravitational force but it is due to the generation of magnetic current due to the presence of strong magnetic elements in the

moon. When the moon rotates these magnetic materials produce magnetic field around the moon and the moon is in atmosphere only and due to the atmosphere electric current generates due to the very fast flowing of air around the moon. This fast flowing of air occurs because the moon is in not normal atmosphere but it is in exosphere which is the very last layer of Earth's atmosphere. This magnetic current generated around the moon, in fact in the Earth's exosphere pulls the sea water. Hence according to my knowledge it is 100% highly impossible for sea level to increase due to gravitational force which is told by Newton.

References:

1. Dark matter was found in 1933 by Fritz Zwicky of the California Institute of Technology to describe the unseen matter that must dominate one feature of the universe—the Coma Galaxy Cluster.
2. In 1687, Sir Isaac Newton explained that ocean tides result from the gravitational attraction of the sun and moon on the oceans of the Earth.
3. In 1927, an astronomer named Georges Lemaître had a big idea. He said that a very long time ago, the universe started as just a single point.
