

What's the matter with electrons?

1. God created our universe of gravity and included particles. We characterize many of the particles as matter. There are so many forms of matter that we wish to understand. To be thorough we started with microscopes to find the smallest of parts, which includes many nuclear points, which we have included as particles. We discuss here some primary components which form the atom. The electrons, nucleus and the proton and neutron parts are addressed. Over time these bits have come to define the atom and serve as classification of primary matter forms called elements in the periodic table. Relating the elements to each other is the science of Chemistry. The scientists proceed by considering how the various assembly of pieces physically relate to matter from the atom and up. Electrons are key parts and dictate the sequence place of the element related to others. There are elements numbered from 1 to over 100 electrons. The lesser elements are mostly gasses and light metals with few electrons.
2. Gasses are elements that are less subject to downward gravity push and reside in the atmosphere, which is a region of lesser "net" gravity. Radiation beams are somewhat like thin matter. We have discussed the idea that radiation penetrates matter and diminishes as the flowing continues inside. Then the flow exits the matter. There is a maximum difference between the exiting pressures and the incoming beam pressure. That interchange point is the surface of the matter. The further above the interchange, the less the difference between the two directions of beams. The further from the surface the fewer the gas particles. Gravity and closeness to surface defines our atmosphere.
3. Where do mass elements come from? Learning this starts by following EM radiation beams which travel at 300,000km. per second. There can be distortions circling the basic beam which we call waves. The number of waves within 1 second helps identify the type of ray. Light rays occupy the 14,000 to 20,000 waves/sec. region of the spectrum of radiation. Obviously, there are very many wave sizes. Maybe someday the spectrum will be called "a spectrum of existence" as gravity and matter creation would be included at the ends. The majority of spatial beams have few waves or frequency and can only perform as gravity pressure.
4. The matter forms have different wave frequencies that produce either light, microwaves, sound waves, x-rays etc. There is an up and down flow around their beam by the waves. Now all beams and their waves rarely interact with other beams in space. But closer to spheres incoming beams bump into the gasses. My bumping concept is the wave portion of one beam hitting another which has opposite flows, one flow up and other down. That is what is required to form a crossing of the beams. The crossing is an electron and it spins because of the up vs down interchange. The electron is given the mass measure of 1 even though it is a crossing rather than matter. Spins must be the basis for measuring masses.
5. The existence of an electron automatically forms an element. The single electron element is hydrogen which has a thinly formed structure and weak retention. It is available for further interchanges with radiation. Another hit of waves can create a second electron and form the gas helium. Further electron counts give metals and later such gasses as oxygen and nitrogen. The element features are dictated by the protons and neutrons. The electron is the beginning of building or creating mass.

6. You have been misled by the metaphysics of today because; 1. The 'mysterious' nature of gravity (push), 2. The erroneous view of universe expansion due to the Doppler theory (book 3), 3. Not understanding that radiation waves are space and need be measured like particles, 4. The unrealized need that orbiting needs a continuing driver, 5. The actual flow of space, 6. Why the solar system is planar, 7. The nature and cause of black holes, dark matter and dark energy. 8. The misplacing of the electron form and its spin are all theory errors for physicists, 9. Our major force of magnetism isn't properly understood as it is part of the flow of gravity. Electrons can redirect gravity beams cause a greater push in one direction and less push in the other direction. The electron magnet displays how electrons can distort gravity.
7. There is another stumble devised by physicists to be addressed here. That is the double splits magic. If a beam of light is aimed thru 1 slit it falls as is on the wall beyond, where the split is pictured by light. If beams are set up to pass thru dual slits, dots of light will fill the back wall with light. The slits are not shown individually. The explanation is this. Radiation beams from all directions interchange including beyond the splits. The interchanges with light from the single slits beam is by gravity beams from all directions. The gravity beams, having no electrons, don't cause electron crossings to form light electrons. For the two light flows each of their offset waves flow outward toward the other light flow. Where the beams of each connect, their waves interchange and form new light electrons. Their meeting sends beams with waves to each other and lighted waves go in many directions. Beyond everything we have reviewed, the maps of the universe don't properly include the fact that the velocity of light beams (our yardstick) are affected by gravity over time.
8. Are these revelations soon to become a new paradigm! I have had and written about most of it for over 30 years and it remains mostly ignored.
9. The earlier alert about the Eden garden death risks is solved here. The real risk implied by the Eden message is: It is the imaginary fourth dimension that is 'disturbing' the minds of many theorists'
