Gravitational field:

$$g = \frac{\alpha(c^2 - Sf^2)^{3/2}}{2\pi f D^2} = \frac{GM}{D^2} \quad ; \quad M = 2 \times 10^{30} \text{ kg}$$

α - Fine structure constant; c - Light speed; $S = 1.9 \times 10^{-34} \text{ m}^2$;
 f - Compton frequency; D - Distance; G - Gravitational constant, M - Mass

Frequency of the virtual photons:

$$f^2 = \frac{2\pi.GM}{\alpha.S^{3/2}} \quad \Leftrightarrow \quad f = 6.62 \times 10^{36} \text{ Hz}$$

Wave speed:

$$w = \sqrt{S}f = 9.13 \times 10^{19} \text{ m/s}$$

Frequency of the neutrino:

$$f_\nu = \frac{h}{Sm_\nu} = 1.6 \times 10^{36} \text{ Hz}$$

The virtual photons are longitudinal waves or magnetic waves. The neutrino is the magnetic monopole.

Gravitational field of the electron:

$$g_e = \frac{\alpha.c^3}{2\pi.f_e D^2} = \frac{G_e m_e}{D^2} \quad ; \quad G_e = \frac{q_e^2}{4\pi\epsilon_0 m_e^2}$$

The real photon is a wave, not a particle, and it is not quantized because its energy varies with frequency. It has constant amplitude.

The sun generates 2×10^{38} neutrinos per second.

The gravitational potential is an electric field.

Gravitational potential:

$$v^2 = \frac{\alpha \cdot w^3}{2\pi \cdot fD}$$

Greisen Zatsepin Kuzmin limit

The Saraiva's constant is universal. First we suppose that it changes in vacuum but now we know that it is a constant and the frequency in vacuum is lower than the frequency in the earth gravitational field.

Saraiva's constant:

$$S = \frac{\epsilon_0^2 \alpha^4}{12\pi^4} = 1.9 \times 10^{-34} m^2; \quad \lambda = \sqrt{S} = 1.3791 \times 10^{-17} m$$

Frequency variation:

$$g_U = 6.9 \times 10^{-10} ms^{-2} \text{ -- Gravitational field of the universe}$$

$$g_T = 9.8ms^{-2} \text{ -- Earth gravitational field}$$

$$f_{VAC} = f_{EARTH} \frac{g_U}{g_T}$$

Light speed w:

f – Frequency

GZK limit:

$$E = 5 \times 10^{19} eV = 8J$$

Classical wrong frequency:

$$f = 1.21 \times 10^{34} \text{ Hz}$$

Correct frequency in earth:

$$E = hf \frac{c^2}{w^2} ; \quad w = \sqrt{c^2 - Sf^2}$$

$$f = f_M = \frac{c}{\sqrt{S}} = 2.17386 \times 10^{25} \text{ Hz}$$

Frequency in vacuum far from gravitational fields:

$$f = f_M \frac{g_U}{g_T} = 1.52 \times 10^{15} \text{ Hz}$$

Energy:

$$E = hf = 6.3 \text{ eV}$$

It's why the GZK limit can be overcome.

$$\Delta w = \frac{Sf^2}{2c} = 7.345 \times 10^{-13} ; \quad w = c - \Delta w$$

The Unified Absolute Relativity Theory has only two constants:

c – “Light speed” – The local speed of rotation of the universe.

$\lambda = \sqrt{S}$ -- The Compton wavelength of the longitudinal waves.

Light speed:

Compton wavelength:

$$x = \frac{\sqrt{c^2 - S f^2}}{f}$$

Visible light in glass

Light speed:

$$n = 1.5 ; \quad f_0 = 5 \times 10^{14} \text{ Hz}$$

Frequency in glass:

$$w = \frac{c}{1.5} = \sqrt{c^2 - S f^2}$$

$$\Leftrightarrow f = \frac{c}{\sqrt{S}} \frac{\sqrt{n^2 - 1}}{n} = 0.745 f_M = 1.6203 \times 10^{25} \text{ Hz}$$

Gravitational potential of the glass:

$$v^2 = (c - \Delta v)^2$$

$$f = \frac{c f_0 \sqrt{c^2 - v^2}}{c^2 - v w_0} \quad \Leftrightarrow \quad f = f_0 \frac{\sqrt{2c\Delta v}}{\Delta v + \Delta w_0}$$

$$w_0 = c - \Delta w_0 \quad ; \quad \Delta w_0 = \frac{Sf_0^2}{2c}$$

$$\Delta v = \frac{cf_0^2}{2f^2} \frac{n-1}{n} = 4.758 \times 10^{-14} \text{ m/s}$$

$$\Delta v = 0.6 \Delta w_0$$
